Project - Code Refactoring and Bug Fixing

Project Description – Using Flask building a web interface that can be used to insert input text in list.

Task – To find Bugs from the data for working good of program

Some Observation:-

1. The project environment verified the installation of Flask, ensuring a prerequisite for the application's functionality.

2. Method Change-

The **POST** method in the `submit` function was replaced with the **GET** method.

This remedied the problem of not storing elements, as the **GET** method is specifically designed to retrieve data from the URL query string

While solving this issue program is working fine
